

# VAICOM - FLT PLN Out

## FLT PLN Tab

The **FLT PLN** tab provides a live, interactive flight plan board in OpenKneeboard:

- View DTC/Route Tool/runtime waypoints
- Adjust route planning values (type, altitude, speed, TOT)
- Switch speed display KCAS/Mach (high altitude)
- Track ETA/ATA behavior
- Review a post-flight event summary

## FLT PLN Source Behaviour

The FLT PLN tab can load from:

- DTC files (**Saved Games\DCS\*\DTC**)
- Route Tool presets (**Saved Games\DCS\*\Config\Route Tool Presets\...**)
- Runtime mission route (fallback when no selected file but runtime waypoint diagnostics exist)

If no valid source exists, a guidance message is shown.

## Access & Layout

### FLT PLN file controls

- **Refresh FLT PLN**
- Selected file label
- Expand/collapse file list

### Route pages

#### **NAVLOG, COM/ROUTE, MAP**

Route selectors (**R1, R2, R3**) appear when available.

### Timing row

**STEP, START, TAXI, TAKE OFF, TOT**

**Post Flight** button.

## Page Functions

### NAVLOG

Primary planning/interaction page:

- Header info (Route, Callsign, Mission, Config, Theater, Source)
- Time planning row (STEP/START/TAXI/TAKEOFF/TOT)
- Full waypoint table with editable controls
- Frequency/Assets/WX info panels

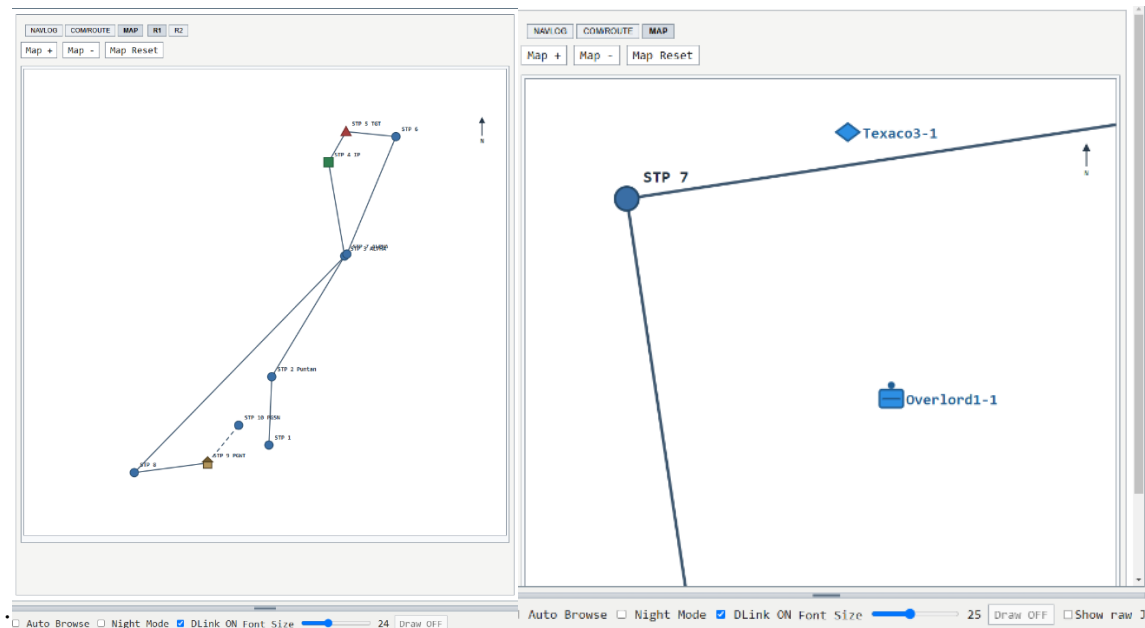

### COM/ROUTE

- COMMS view (runtime or DTC-derived)
- Route summary by route channel

## MAP

- Mud map rendering of waypoints
- Route symbols and leg lines
- Map controls: zoom in/out/reset
- Drag-to-pan support
- DLink (datalink assets display)

## Editable Waypoint Controls

### TYPE

- Left/right arrows cycle route type labels (WP, IP, TGT, AAR, CAP, HLD, TKO, LDG, DVRT, etc.)

### ALT

- Left/right arrows adjust altitude using adaptive step rules:
  - **< 1000 ft:** 100 ft steps
  - **>= 1000 ft:** 500 ft steps

- If imported altitude is uneven (example **436**), first click snaps to nearest valid boundary in click direction, then continues stepping normally.

## SPD

- Left/right arrows:
  - **KCAS mode:**  $\pm 10$  KCAS per click
  - **Mach mode:**  $\pm 0.01$  Mach equivalent per click (internally converted)
- Click speed value to toggle display:
  - **KCAS <-> Mach** when altitude is above 28,000 ft
  - KCAS only below that altitude

## Time Planning Functions

### STEP / START / TAXI / TAKEOFF click behaviour

Clicking a timing cell sets that cell to **current mission time** and updates only subsequent milestones:

- Click **STEP**: updates STEP, START, TAXI, TAKEOFF
- Click **START**: updates START, TAXI, TAKEOFF
- Click **TAXI**: updates TAXI, TAKEOFF
- Click **TAKE OFF**: updates TAKE OFF only

This supports in-flight timeline correction without overwriting earlier milestones.

### TOT controls

Use « ◀ ▶ » to adjust TOT target:

- seconds and minutes adjustments supported
- existing backward-planning logic remains active

### ETA / ATA Function

In waypoint ETA column:

- Click ETA value to set **ATA** at current mission time for that waypoint
- ATA displays in blue

- Click again to revert ATA back to ETA display

Only waypoints explicitly clicked for ATA are included in ATA-related summary rows.

## Post Flight Summary

Use **Post Flight** button:

- Opens/closes a full flight event summary panel
- Includes timeline events and ATA delta rows (ahead/behind format)
- Intended for tester debrief and verification of planning interactions

|                          |                                                                                 |
|--------------------------|---------------------------------------------------------------------------------|
| Hide Post Flight         |                                                                                 |
| POST FLIGHT SUMMARY      |                                                                                 |

| 2026-06-10T20:11:30.082Z | ATA STP2 -00:54:13                                                              |

## Expected Notes / Limitations

- Mach display is only available for high-altitude rows (>28,000 ft).
- Some COM/CMD5 content depends on source data availability (DTC/runtime diagnostics).
- MAP content quality depends on waypoint coordinate quality and source completeness.
- Runtime route fallback requires mission diagnostics providing player/group waypoints.
